

TORONTO, Sept. 27, 2017 (GLOBE NEWSWIRE) -- [MacDonald Mines Exploration Ltd.](#) (TSX-V:BMK) ("MacDonald Mines", "MacDonald", or the "Company") is pleased to announce that it has entered into a Memorandum of Understanding ("MOU") with the Michipicoten First Nation ("MFN"). The MOU outlines a clear and mutually agreed upon process for consultation between the parties during the exploration phase of the Wawa-Holdsworth Gold Project. The Project located 20 km northeast of Wawa, Ontario, consists of fee simple lands and mining claims that are located in the MFN Territory.

The MFN is a signatory of the 1850 Robinson-Superior Treaty and an aboriginal people within the meaning of Section 35 of the *Constitution Act, 1982*, and as such, asserts aboriginal and treaty rights within the area.

Quentin Yarie, President and Chief Executive Officer of MacDonald Mines stated, *"MacDonald Mines is committed to fostering a mutually beneficial working relationship with the MFN as we continue to advance the Wawa-Holdsworth Project. Founded on principles of trust, respect and understanding, this MOU formalizes the consultation process and enables MFN to understand the potential impacts of the development of the Project on the exercise of aboriginal and treaty rights."*

It has been a pleasure to work with Chief Tangie and her representatives. The MFN has been considerate and understanding through the whole process and MacDonald Mines does not envision anything different as we move towards more intensive exploration and development considerations in the future."

Wawa-Holdsworth Project Overview

Neighbouring Richmond's Island Gold Mine, Argonaut's Magino Gold Project and Goldcorp's Borden project, the 1142 acres Wawa-Holdsworth Gold Project has all the attributes to host a large gold system with numerous gold showings occurring in a 500-metre-wide deformation corridor. Historic work by previous operators defined three gold targets on the Wawa-Holdsworth Project: 1) Greenstone-hosted quartz-carbonate vein deposits (Soocana Vein System and Reed-Booth Showing); 2) BIF-hosted gold deposits (gold-bearing pyrite zones in an Algoma-type iron formation); and 3) Gold-bearing Oxide Sands developed from the weathering of the auriferous Pyrite Zones.

MacDonald is focusing its near-term exploration program on the Oxide Sands. The soft and relatively unconsolidated material can be extracted like an aggregate and the Company is evaluating its potential extraction.

A recent EM Max-Min survey confirmed that the sands extend at least 1.8 km along strike and reach depths beyond 8 m. MacDonald's trenching and sampling program returned up to 6.45 g/t gold (TR775-0), up to 52.7g/t silver (TR750-6) and expanded the lateral extents of the "black sands". The discovery of new precious metals (gold and silver) horizons within the soil profile indicate that the gold and silver inventory of the Oxide Sands at the Wawa-Holdsworth Project may be larger than initially anticipated.

Preliminary metallurgical test work has shown that conventional flotation techniques can be used to concentrate the precious metals. Last week, the Company initiated a 2,000m sonic drilling program to assess the vertical distribution of the precious metals within the Sands with the ultimate goal of developing a resource.
