

VR Discovers High Grade Copper-Silver-Gold Mineralization Along 6,000 Metre Trend at Its Junction Property, Nevada

12.12.2017 | [GlobeNewswire](#)

VANCOUVER, British Columbia, Dec. 12, 2017 (GLOBE NEWSWIRE) -- [VR Resources Ltd.](#) (TSX.V:VRR) (FSE:5VR), the "Company", or "VR", is pleased to announce the discovery of high grade, polymetallic copper-silver-gold sulphide mineralization along a strike length of 6 kilometres at its Junction property in north-central Nevada, located some 50 kilometres north of its flagship Bonita copper-gold Property. Highlights of the Company's surface prospecting and mapping program at Junction include:

- High grade copper-silver-gold mineralization on surface at 29 different locations in two main areas spanning a 6 kilometre strike length within a regional-scale shear zone.
- Of 99 surface grab samples collected for geochemistry from across the property:
 - 47 samples contain greater than 1% copper:
 - Samples of tenorite-cuprite veins have up to 37.4% Cu, with 340 g/t Ag and 2.13 g/t Au.
 - Samples of massive digenite-covelite-chalcopryrite veins contain up to 45.1% Cu, with 560 g/t Ag and 1.09 g/t Au.
 - 17 samples contain greater than 100 g/t silver:
 - Samples of massive cuprite-argentite veins contain up to 735 g/t Ag, with 36.2% Cu and 0.388 g/t Au.
 - 32 samples contain greater than 1 g/t gold:
 - Samples of quartz vein spatially associated with pegmatites contain up to 26.8 g/t Au (0.78 oz/ton), with 14.4 g/t Ag and 0.06% Cu as disseminated sulphides within the veins.
 - Very high statistical correlation coefficient (0.88) between copper and silver in 99 samples.
- Continuity of copper, gold and silver enrichment in soil is evident along 1 kilometre of strike over the western zone (grid = 307 samples on 16 lines; the eastern zone is yet to be covered).
- High temperature trace elements such as tungsten (W) demonstrate continuity between the surface showings of copper-silver-gold sulphide mineralization.
- The Company has quadrupled the size of the property, to 70 claims covering 1446 acres (585 ha).

Copper-silver sulphide mineralization is related to quartz-feldspar pegmatite dykes and associated quartz veins within biotite-hornblende orthogneiss which forms the northern extent of the northeast-trending, regional-scale Antelope shear zone which hosts the Ashdown moly-gold deposit located some 10 kilometres to the southwest of the Junction property. Copper-silver sulphide assemblages include digenite-covellite-tenorite-argentite; chrysocolla is common, less so glassy limonite and chalcopryrite. Sulphides occur in both veins and blebs in pegmatite and quartz vein within and proximal to pegmatite. Quartz veins have metre-scale iron carbonite alteration envelopes in pegmatite locally. More complete descriptions are on the Junction project page on the Company's website at [www.vrr.ca](#). Maps of the geochemical data highlighted above and field photos are included with this news release on the website [www.vrr.ca/news](#).

Commenting on the news today, VR's CEO Dr. Gunning reiterated: *"Simply stated, Junction has surpassed our expectations. The consistent rock and mineral associations in nearly 30 different occurrences across 6 kilometres of strike speaks to a robust mineralizing system. The copper and silver mineral assemblages highlight the unusual grade potential of this newly discovered trend. The occurrence within the Antelope Shear Zone underscores a crustal-scale anchor to the orogenic-style, mesothermal veins at Junction, reinforced by the past-producing Ashdown mine to the southwest. To be clear, we view these collective attributes at Junction as highly prospective and a material opportunity for the Company in 2018."*

VR plans to aggressively follow-up this discovery in 2018. VR is planning for a high resolution EM geophysical survey over the property in Q1 2018 to map the sulphide system at Junction at depth, and to evaluate and prioritize targets areas for potential first-pass diamond drilling.

As previously reported, plans are underway for follow-up drilling at the Company's Bonita copper-gold

property in 2018, upon the recent completion of the 2017 fall program, for which the Company hopes to have complete and final data to release in early January.

About The Junction Property

The Junction property is located in Humboldt County, near the Nevada & Oregon border, immediately east of Highway 140. The nearby town of Denio Junction is less than 6 kilometres to the north, and facilitates effective and cost-efficient field exploration programs. The Company has expertise to leverage and synergies to exploit at Junction by applying its extensive exploration experience during the past three years in northwestern Nevada at its nearby Bonita property.

The Junction property consists of 70 claims in two contiguous blocks covering 1,446 acres (585 hectares) within an area of approximately 5 by 5 kilometres. The property is on land administered by the federal Bureau of Land Management (BLM). No state or federal land use designations or privately-owned lands impede access to the property, nor is the property within the BLM's broadly defined area of proposed sage grouse protection.

The property is owned 100% by VR, registered to the Company's wholly-owned, Nevada-registered US subsidiary Renntiger Resources USA Ltd. The 15 core claims of the western block of the property were acquired from a private company in August 2017 (see terms in NR dated August 30, 2017); all other claims were staked directly by VR.

Technical Information

Rock samples for geochemistry are submitted to the ALS Global facilities in Reno, Nevada, with final analytical work completed at the ALS laboratories located in Vancouver, BC., including ICP-MS analyses for base metals and trace elements, and gold determination by atomic absorption assay.

Technical information for this news release has been prepared in accordance with the Canadian regulatory requirements set out in National Instrument 43-101, and reviewed on behalf of the Company by Dr. Michael Gunning P.Geo., a non-independent Qualified Person.

About VR Resources

[VR Resources Ltd.](#) ("VR") is a new listing in the junior exploration space (TSX.V:VRR) (Frankfurt:5VR). The diverse experience and proven track record of its Board in early-stage exploration and discovery is the foundation of VR. The Company is focused on exploring large copper-gold mineral systems in the western United States. VR is the continuance of 4 years of active exploration in Nevada by a Vancouver-based private exploration company. VR is well financed for its exploration strategy, including first-pass drilling of its core asset, the Bonita Property. VR owns its exploration assets outright, and will evaluate new opportunities on an ongoing basis, whether by staking or acquisition.

ON BEHALF OF THE BOARD OF DIRECTORS:

"Michael H. Gunning"

Dr. Michael H. Gunning, PhD, PGeo
President & CEO

Forward Looking Statements

This press release contains forward-looking statements. Forward-looking statements are typically identified by words such as: believe, expect, anticipate, intend, estimate, postulate and similar expressions or are those which, by their nature, refer to future events. Forward looking statements in this release include but are not limited to: plans to aggressively follow up this discovery; plans for a high-resolution EM geophysical survey.

Although the Company believes that the use of such statements is reasonable, there can be no assurance that such statements will prove to be accurate, and actual results and future events could differ materially from those anticipated in such statements. The Company cautions investors that any forward-looking statements by the Company are not guarantees of future performance, and that actual results may differ materially from those in forward-looking statements. Trading in the securities of the Company should be considered highly speculative.

All of the Company's public disclosure filings may be accessed via www.sedar.com and readers are urged to review these materials.

Neither the TSX Venture Exchange nor its Regulation Services Provider (as that term is defined in Policies of the TSX Venture Exchange) accepts responsibility for the adequacy or accuracy of this release
