

Pegasus Resources Hires Dahrouge Geological Consulting to Manage Exploration of Energy Sands Uranium Project in Utah

07.04.2022 | [GlobeNewswire](#)

VANCOUVER, April 07, 2022 - [Pegasus Resources Inc.](#) (TSX-V: PEGA; Frankfurt - OQS2, OTC/Pink Sheet symbol: SLTFF) (the "Company" or "Pegasus") is pleased to announce the hiring of Dahrouge Geological Consulting Ltd to manage the field exploration work on the recently acquired Energy Sands Uranium Project located in Emery County, Utah. This geological work will be managed by Dahrouge's Denver based field exploration team and the initial ground project is expected to commence shortly.

The Energy Sands Project (the "Property" or "Project"), is located in Emery County, Utah. The Project consists of sandstone-hosted uranium and vanadium mineralization with demonstrated potential to establish resources, with historical small-scale mining having occurred in two isolated regions of the Property.

Project highlights:

- 30 unpatented lode claims, totalling 600 acres
- Located within the San Rafael Uranium District, and approximately 4 kilometres from the San Rafael Uranium Project of Western Uranium.
- Historical small-scale production, between 1953 and 1956, totalling 51.8 Tons at a grade of 0.373% U₃O₈ and 1.10% V₂O₅.

Uranium mineralization on the Project is hosted within the Salt Wash Member of the Jurassic Morrison Formation. Mineralization within the Tidwell Mineral Belt of the San Rafael Uranium District is oriented in a series of roughly northeast trends. Individual mineralized bodies are tabular to lenticular with the long axis aligned along the trend.

The Energy Sands Project is on-trend and approximately four kilometres from the Western Uranium's Rafael Uranium Project, which is host to 758,050 tons of indicated mineral resources averaging 0.225% U₃O₈ and 0.30% V₂O₅ (containing 3,404,600 million pounds of U₃O₈ and 4,595,600 million pounds of V₂O₅); and 453,850 tons of inferred mineral resources averaging 0.205% U₃O₈ and 0.28% V₂O₅ (containing 1,859,600 million pounds of U₃O₈ and 2,510,600 million pounds of V₂O₅), at a cut off grade of 0.06% U₃O₈ (from the Nov-19, 2014 Technical Report filed by Western Uranium).

Management cautions that past results or discoveries on adjacent properties (i.e. Rafael Uranium) may not necessarily be indicative to the presence of mineralization on the Company's properties (i.e. Energy Sands).

A historical report, archived by the United States Geological Survey (USGS) outlines small-scale production of uranium by the Minerals Corporation of America, totalling 51.8 Tons at a grade of 0.373% U₃O₈ and 1.10% V₂O₅ occurred between 1953 and 1956 (Byers & Robertson, 1956).

The Company's QP is not able to verify the amount and grades of the historical production.

Pine Channel Uranium

In further news, Pegasus is continuing the permitting process for its Pine Channel uranium project located in the northern Athabasca Basin, Saskatchewan with a view to commence work shortly after receipt of permits.

Qualified Person

The technical information contained in this news release has been reviewed by Neil McCallum B.Sc., P.Geo., of Dahrouge Geological Consulting, who is a "Qualified Person" as defined in NI 43-101.

About Pegasus Resources Inc.

Pegasus Resources Inc. is a diversified Junior Canadian Mineral Exploration Company with a focus on uranium, gold and base metal properties in North America. The Company is also actively pursuing the right opportunity in other resources to enhance shareholder value. For additional information please visit the Company at www.pegasusresourcesinc.com or contact Charles Desjardins at charles@pegasusresourcesinc.com.

On Behalf of the Board of Directors
